

Login VSI and JetPatch: Taking Patch and Testing Automation to a New Level

JetPatch: Intelligent Patch Automation and Vulnerability Remediation

JetPatch is a vulnerability remediation and governance platform that uses machine learning to generate insights about software patching rollout success. It shortens time to remediation, increases enterprise security, eliminates human errors, and minimizes systems downtime.

The platform helps to shorten the time to remediation with these features:

- Continuous Compliance
- Optimized Downtime
- End-to-End Workflow Automation
- Patch Prediction Success
- Process Governance

Login VSI: Maximizing End-User Experience

Login VSI is the only solution in the market guaranteed to maximize the end-user experience on any digital workspace. We do this by using synthetic users to test automatically and validate the impact of change in physical, virtual, and cloud-based workspaces, safeguarding application, and desktop performance.

Ensure business continuity, mitigate risk and reduce downtime by continuously testing:

- Performance and Availability
- Application Load
- Compatibility

Combined Solution for Automated Patch Deployment

The automation and testing from Login VSI and JetPatch improve efficiency and provides intelligence in change management. The integration of both solutions gets an end-to-end system that closes the methodology’s gap, accelerates the time to remediate for OS and Application vulnerabilities by taking people out of the process and having a repeatable testing methodology.

This combination delivers:

- Faster time to remediate
- Predictive patch and test resulting in fewer post-deployment issues
- Lower risk of disruption/downtime
- Expanded coverage of testing to include a wide range of applications, not just the top 1%
- Orchestrated testing to ensure business continuity

About Login VSI

Login VSI automatically tests and validates the impact of change to physical, virtual and cloud-based workspaces, to maximize the true end-user experience.
