# Cumbersome repository complexity across multiple Linux distributions

JetPatch

Is it time to consolidate your multiple Linux repositories to reduce complexity and the time spent on patching?

Today, multiple Linux environments are a part of IT infrastructure, but that doesn't mean that complex and slow patching across distributions should be too.

The Challenge:

Maintaining separate repositories for each Linux distribution takes a lot of time and mental energy. Moreover, updating each OS using different tools, commands, and scripts complicates things even further.

This level of repository complexity delays remediation and costs thousands of hours wasted on tasks that you can consolidate instead.

Different tools, commands, and scripts

Costly delays

How JetPatch solves this problem for Linux:

JetPatch can help you to speed up and simplify the process by consolidating your multiple Linux repositories into a single repo for all your Linux distributions.

In addition, JetPatch gives you the power of intuitive patch automation so that you can master and optimize your Linux operations to save even more precious time.

Single repo for all your Linux distributions
